Introduction

About the project kit
Both the project kit and the supporting material have been carefully designed for use in KS3 Design and Technology lessons. The project kit has been designed so that even teachers with a limited knowledge of electronics should have no trouble using it as a basis from which they can form a scheme of work.

The project kits can be used in two ways:
1. As part of a larger project involving all aspects of a product design, such as designing an enclosure for the electronics to fit into.
2. On their own as a way of introducing electronics and electronic construction to students over a number of lessons.

This booklet contains a wealth of material to aid the teacher in either case.

Using the booklet
The first few pages of this booklet contain information to aid the teacher in planning their lessons and also covers worksheet answers. The rest of the booklet is designed to be printed out as classroom handouts. In most cases all of the sheets will not be needed, hence there being no page numbers, teachers can pick and choose as they see fit.

Please feel free to print any pages of this booklet to use as student handouts in conjunction with Kitronik project kits.

Support and resources
You can also find additional resources at www.kitronik.co.uk. There are component fact sheets, information on calculating resistor and capacitor values, puzzles and much more.

Kitronik provide a next day response technical assistance service via e-mail. If you have any questions regarding this kit or even suggestions for improvements, please e-mail us at:
support@kitronik.co.uk
Alternatively, phone us on 0845 8380781.
Schemes of Work

Two schemes of work are included in this pack; the first is a complete project including the design & manufacture of an enclosure for the kit (below). The second is a much shorter focused practical task covering just the assembly of the kit (next page). Equally, feel free to use the material as you see fit to develop your own schemes.

Before starting we would advise that you to build a kit yourself. This will allow you to become familiar with the project and will provide a unit to demonstrate.

Complete product design project including electronics and enclosure

| Hour 1 | Introduce the task using ‘The Design Brief’ sheet. Demonstrate a built unit. Take students through the design process using ‘The Design Process’ sheet.  
|        | Homework: Collect examples of electronic products that are sold to the 5-10 year old age group. List the common features that make these suitable for this age group. |
| Hour 2 | Develop a specification for the project using the ‘Developing a Specification’ sheet.  
|        | Resource: Sample of products design for the target age group of this project.  
|        | Homework: Using the internet or other search method, find out what is meant by ‘design for manufacture’. List five reasons why design for manufacture should be considered on any design project. |
| Hour 3 | Read ‘Designing the Enclosure’ sheet. Develop a product design using the ‘Design’ sheet.  
|        | Homework: Complete design. |
| Hour 4 | Using cardboard, get the students to model their enclosure design. Allow them to make alterations to their design if the model shows any areas that need changing. |
| Hour 5 | Split the students into groups and get them to perform a group design review using the ‘Design Review’ sheet. |
| Hour 6 | Using the ‘Soldering in Ten Steps’ sheet, demonstrate and get students to practice soldering. Start the ‘Resistor Value’ worksheet.  
|        | Homework: Complete any of the remaining resistor tasks. |
| Hour 7 | Build the electronic kit using the ‘Build Instructions’. |
| Hour 8 | Complete the build of the electronic kit. Check the completed PCB and fault find if required using the ‘Checking Your Game PCB’ section and the fault finding flow charts.  
|        | Homework: Read ‘How the Game Works’ sheet. |
| Hour 9 | Build the enclosure.  
|        | Homework: Collect some examples of instruction manuals. |
| Hour 10 | Build the enclosure.  
|        | Homework: Read ‘Instruction Manual’ sheet and start developing instructions for the game design. |
| Hour 11 | Build the enclosure.  
|        | Homework: Complete instructions for the game design. |
| Hour 12 | Using the ‘Evaluation’ and ‘Improvement’ sheet, get the students to evaluate their final product and state where improvements can be made. |

Additional Work  
Package design for those who complete ahead of others.

The Design Process

The design process can be short or long, but will always consist of a number of steps that are the same on every project. By splitting a project into these clearly defined steps, it becomes more structured and manageable. The steps allow clear focus on a specific task before moving to the next phase of the project. A typical design process is shown on the right.

**Design brief**
What is the purpose or aim of the project? Why is it required and who is it for?

**Investigation**
Research the background of the project. What might the requirements be? Are there competitors and what are they doing? The more information found out about the problem at this stage, the better, as it may make a big difference later in the project.

**Specification**
This is a complete list of all the requirements that the project must fulfil - no matter how small. This will allow you to focus on specifics at the design stage and to evaluate your design. Missing a key point from a specification can result in a product that does not fulfil its required task.

**Design**
Develop your ideas and produce a design that meets the requirements listed in the specification. At this stage it is often normal to prototype some of your ideas to see which work and which do not.

**Build**
Build your design based upon the design that you have developed.

**Evaluate**
Does the product meet all points listed in the specification? If not, return to the design stage and make the required changes. Does it then meet all of the requirements of the design brief? If not, return to the specification stage and make improvements to the specification that will allow the product to meet these requirements and repeat from this point. It is normal to have such iterations in design projects, though you normally aim to keep these to a minimum.

**Improve**
Do you feel the product could be improved in any way? These improvements can be added to the design.
The Design Brief

An electronic games manufacturer has an idea for an electronic game for young children aged between 5 and 10. The game has two modes. The first is a memory game aimed at speeding their mental development up. The second is a reaction game aimed at developing hand-eye coordination. The game has been developed to a working prototype Printed Circuit Board (PCB) stage.

The manufacturer is unsure how the final product should look and feel as they do not normally make products for this age group. The manufacturer has asked you to develop the product for its target market, meeting all of the requirements a product for this age group has.

Description of the memory game
The LEDs will flash a sequence. The user simply copies this sequence. If they get it correct the LEDs will flash the sequence again with an extra LED flash on the end. When the pattern is copied incorrectly the LEDs quickly flash in turn three times then the score is shown. The longer the sequence achieved, the better the score.

Description of the reaction game
After a random amount of time one of the four LEDs will be illuminated. Simply press the button next to the LED before the LED goes off. If the button has been pressed fast enough, then a short while later a new LED will turn on. This time, there is less time to press the button to stay in the game. When the button is not pressed fast enough the LEDs quickly flash in turn three times then the score is shown.

Complete Circuit
A fully built circuit is shown below.
Investigation / Research

Using a number of different search methods, find examples of similar products that are already on the market. Use additional pages if required.

Name .................................................................  Class ......................................................
Developing a Specification

Using your research into the target market for the product, identify the key requirements for the product and explain why each of these is important.

Name.................................................................................. Class..............................................

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Reason</th>
</tr>
</thead>

<td>Example: A toy for a young child should have no sharp corners.</td>
<td>Example: So that the child does not injure themselves when using the toy.</td>
</tr>
</tbody>
</table>
Design

Develop your ideas to produce a design that meets the requirements listed in the specification.

Name....................................................... Class..................................................
Design Review (group task)

Split into groups of three or four. Take it in turns to review each person’s design against the requirements of their specification. Also look to see if you can spot any additional aspects of each design that may cause problems with the final product. This will allow you to ensure that you have a good design and catch any faults early in the design process. Note each point that is made and the reason behind it. Decide if you are going to accept or reject the comment made. Use these points to make improvements to your initial design.

</table>
Soldering in Ten Steps

1. Start with the smallest components working up to the taller components, soldering any interconnecting wires last.
2. Place the component into the board, making sure that it goes in the right way around and the part sits flush against the board.
3. Bend the leads slightly to secure the part.
4. Make sure that the soldering iron has warmed up and if necessary, use the damp sponge to clean the tip.
5. Place the soldering iron on the pad.
6. Using your free hand, feed the end of the solder onto the pad (top picture).
7. Remove the solder, then the soldering iron.
8. Leave the joint to cool for a few seconds.
9. Using a pair of cutters, trim the excess component lead (middle picture).
10. If you make a mistake heat up the joint with the soldering iron, whilst the solder is molten, place the tip of your solder extractor by the solder and push the button (bottom picture).

Solder joints

| Good solder joint | Too little solder | Too much solder |
Resistor Values

A resistor is a device that opposes the flow of electrical current. The bigger the value of a resistor, the more it opposes the current flow. The value of a resistor is given in Ω (ohms) and is often referred to as its ‘resistance’.

Identifying resistor values

<table>
<thead>
<tr>
<th>Band Colour</th>

<td>3</td>
<td>1000</td>
<td>2%</td>
</tr>
<tr>
<td>Orange</td>
<td>4</td>
<td>4</td>
<td>10,000</td>
<td></td>
</tr>
<tr>
<td>Yellow</td>
<td>5</td>
<td>5</td>
<td>100,000</td>
<td></td>
</tr>
<tr>
<td>Green</td>
<td>6</td>
<td>6</td>
<td>1,000,000</td>
<td></td>
</tr>
<tr>
<td>Blue</td>
<td>7</td>
<td>7</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Violet</td>
<td>8</td>
<td>8</td>
<td></td>
<td></td>
</tr>
<tr>
<td>White</td>
<td>9</td>
<td>9</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example: Band 1 = Red, Band 2 = Violet, Band 3 = Orange, Band 4 = Gold

The value of this resistor would be:
2 (Red) 7 (Violet) x 1,000 (Orange) = 27 x 1,000 = 27,000 with a 5% tolerance (gold) = 27KΩ

Too many zeros?
Kilo ohms and mega ohms can be used:
1,000Ω = 1K
1,000K = 1M

Resistor identification task

Calculate the resistor values given by the bands shown below. The tolerance band has been ignored.

<table>
<thead>
<tr>
<th>1st Band</th>
<th>2nd Band</th>
<th>Multiplier x</th>
<th>Value</th>
</tr>
</thead>
<tbody>

<td>Grey</td>
<td>Yellow</td>
<td></td>
</tr>
<tr>
<td>Orange</td>
<td>White</td>
<td>Black</td>
<td></td>
</tr>
</tbody>
</table>
Calculating resistor markings
Calculate what the colour bands would be for the following resistor values.

<table>
<thead>
<tr>
<th>Value</th>
<th>1st Band</th>
<th>2nd Band</th>
<th>Multiplier x</th>
</tr>
</thead>
<tbody>
<tr>
<td>180 Ω</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3,900 Ω</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>47,000 (47K) Ω</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1,000,000 (1M) Ω</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

What does tolerance mean?
Resistors always have a tolerance but what does this mean? It refers to the accuracy to which it has been manufactured. For example if you were to measure the resistance of a gold tolerance resistor you can guarantee that the value measured will be within 5% of its stated value. Tolerances are important if the accuracy of a resistor's value is critical to a design's performance.

Preferred values
There are a number of different ranges of values for resistors. Two of the most popular are the E12 and E24. They take into account the manufacturing tolerance and are chosen such that there is a minimum overlap between the upper possible value of the first value in the series and the lowest possible value of the next. Hence there are fewer values in the 10% tolerance range.

<table>
<thead>
<tr>
<th>E-12 resistance tolerance (± 10%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>

</table>
LEDs & Current Limit Resistors

Before we look at LEDs, we first need to start with diodes. Diodes are used to control the direction of flow of electricity. In one direction they allow the current to flow through the diode, in the other direction the current is blocked.

An LED is a special diode. LED stands for Light Emitting Diode. LEDs are like normal diodes, in that they only allow current to flow in one direction, however when the current is flowing the LED lights.

The symbol for an LED is the same as the diode but with the addition of two arrows to show that there is light coming from the diode. As the LED only allows current to flow in one direction, it’s important that we can work out which way the electricity will flow. This is indicated by a flat edge on the LED.

For an LED to light properly, the amount of current that flows through it needs to be controlled. To do this we use a current limit resistor. If we didn’t use a current limit resistor the LED would be very bright for a short amount of time, before being permanently destroyed.

To work out the best resistor value we need to use Ohm’s Law. This connects the voltage across a device and the current flowing through it to its resistance.

Ohm’s Law tells us that the flow of current (I) in a circuit is given by the voltage (V) across the circuit divided by the resistance (R) of the circuit.

\[ I = \frac{V}{R} \]

Like diodes, LEDs drop some voltage across them: typically 1.8 volts for a standard LED. However the high brightness LED used in the ‘white light’ version of the lamp drops 3.5 volts.

The USB lamp runs off the 5V supply provided by the USB connection so there must be a total of 5 volts dropped across the LED (V_{LED}) and the resistor (V_{R}). As the LED manufacturer’s datasheet tells us that there is 3.5 volts dropped across the LED, there must be 1.5 volts dropped across the resistor. (V_{LED} + V_{R} = 3.5 + 1.5 = 5V).

LEDs normally need about 10mA to operate at a good brightness. Since we know that the voltage across the current limit resistor is 1.5 volts and we know that the current flowing through it is 0.01 Amps, the resistor can be calculated.

Using Ohm’s Law in a slightly rearranged format:

\[ R = \frac{V}{I} = \frac{1.5}{0.01} = 150\Omega \]

Hence we need a 150Ω current limit resistor.
LEDs Continued

The Colour Changing LEDs used in the ‘colour’ version of the lamp has the current limit resistor built into the LED itself. Therefore no current limit resistor is required. Because of this, a ‘zero Ω’ resistor is used to connect the voltage supply of 5V directly to the Colour Changing LED.

Packages

LEDs are available in many shapes and sizes. The 5mm round LED is the most common. The colour of the plastic lens is often the same as the actual colour of light emitted — but not always with high brightness LEDs.

Advantages of using LEDs over bulbs

Some of the advantages of using an LED over a traditional bulb are:

- **Power efficiency**: LEDs use less power to produce the same amount of light, which means that they are more efficient. This makes them ideal for battery power applications.
- **Long life**: LEDs have a very long life when compared to normal light bulbs. They also fail by gradually dimming over time instead of a sharp burn out.
- **Low temperature**: Due to the higher efficiency of LEDs, they can run much cooler than a bulb.
- **Hard to break**: LEDs are much more resistant to mechanical shock, making them more difficult to break than a bulb.
- **Small**: LEDs can be made very small. This allows them to be used in many applications, which would not be possible with a bulb.
- **Fast turn on**: LEDs can light up faster than normal light bulbs, making them ideal for use in car break lights.

Disadvantages of using LEDs

Some of the disadvantages of using an LED over a traditional bulb are:

- **Cost**: LEDs currently cost more for the same light output than traditional bulbs. However, this needs to be balanced against the lower running cost of LEDs due to their greater efficiency.
- **Drive circuit**: To work in the desired manner, an LED must be supplied with the correct current. This could take the form of a series resistor or a regulated power supply.
- **Directional**: LEDs normally produce a light that is focused in one direction, which is not ideal for some applications.

Typical LED applications

Some applications that use LEDs are:

- Bicycle lights
- Car lights (break and headlights)
- Traffic lights
- Indicator lights on consumer electronics
- Torches
- Backlights on flat screen TVs and displays
- Road signs
- Information displays
- Household lights
- Clocks
### Instruction Manual

Your electronic game is going to be supplied with some instructions. Identify four points that must be included in the instructions and give a reason why.

<table>
<thead>
<tr>
<th>Point to include</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Evaluation

It is always important to evaluate your design once it is complete. This will ensure that it has met all of the requirements defined in the specification. In turn, this should ensure that the design fulfils the design brief.

Check that your design meets all of the points listed in your specification.

Show your product to another person (in real life this person should be the kind of person at which the product is aimed). Get them to identify aspects of the design, which parts they like and aspects that they feel could be improved.

<table>
<thead>
<tr>
<th>Good aspects of the design</th>
<th>Areas that could be improved</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Improvements

Every product on the market is constantly subject to redesign and improvement. What aspects of your design do you feel you could improve? List the aspects that could be improved and where possible, draw a sketch showing the changes that you would make.
**Packaging Design**

If your product was to be sold in a high street electrical retailer, what requirements would the packaging have? List these giving the reason for the requirement.

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Reason</th>
</tr>
</thead>
</table>

Develop a packaging design for your product that meets these requirements. Use additional pages if required.
ELECTRONIC GAME KIT

ESSENTIAL INFORMATION
BUILD INSTRUCTIONS
CHECKING YOUR PCB & FAULT-FINDING
MECHANICAL DETAILS
HOW THE KIT WORKS

BUILD YOUR OWN MEMORY & REACTIONS

Version 2.0
Build Instructions

Before you start, take a look at the Printed Circuit Board (PCB). The components go in the side with the writing on and the solder goes on the side with the tracks and silver pads.

1. PLACE RESISTORS

Start with the three resistors:
The text on the PCB shows where R1, R2 etc go.
Ensure that you put the resistors in the right place (i.e. the 47Ω goes in to R7).

<table>
<thead>
<tr>
<th>PCB Ref</th>
<th>Value</th>
<th>Colour Bands</th>
</tr>
</thead>
<tbody>
<tr>
<td>R1 – R6</td>
<td>680Ω</td>
<td>Blue, grey, brown</td>
</tr>
<tr>
<td>R7</td>
<td>47Ω</td>
<td>Yellow, purple, black</td>
</tr>
</tbody>
</table>

2. SOLDER THE IC HOLDER

Solder the Integrated Circuit (IC) holder in to IC1. When putting this into the board, be sure to get it the right way around. The notch on the IC holder should line up with the notch on the lines marked on the PCB.

3. SOLDER THE SWITCHES

Solder the four switches into the board where it is labelled SW1, SW2, SW3 & SW4. Once you have got the pins lined up with the holes, they can be pushed firmly into place.

4. SOLDER THE LEDs

Solder the four Light Emitting Diodes (LEDs) into LED1 – LED4. It does not matter which colour goes where but the game won’t work if they don’t go in the right way around. If you look carefully one side of the LED has a flat edge, which must line up with the flat edge on the lines on the PCB.

5. SOLDER THE SWITCH

Solder the PCB Mount Right Angled On / Off Switch into SW5. The row of three pins that exit the back of the switch must be soldered, but it doesn’t matter too much if you can’t solder the other two pins.

6. FIT THE BATTERY HOLDER

Finally place the battery holder into the board so that it sticks out off the edge of the board. This part should be soldered with the holder raised off from the board with 5mm of lead going through to the back of the board.
The IC can be put into the holder, ensuring that the notch on the chip lines up with the notch on the holder.

Check that the board works before folding the battery holder under the board and fixing in place with the M3 nut and bolt.

Checking Your Game PCB

Check the following before you insert the batteries:

Check the bottom of the board to ensure that:
- All holes (except the 5 large 3 mm holes) are filled with the lead of a component.
- All these leads are soldered.
- Pins next to each other are not soldered together.

Check the top of the board to ensure that:
- The notch on the IC holder / IC is near the edge of the board.
- The flat edge of each of the LEDs is next to the switch.
- The colour bands on R7 are yellow, purple, black.

Testing the PCB

The software on the microcontroller has been specially designed to allow easy testing of the PCB.

When the batteries are inserted and SW5 is in the on position, the game will:
- Illuminate LED1, LED2, LED3 & LED4 in sequence for one second each.
  - If the LEDs don’t light in order, stop testing and look at the LED fault finding flow chart.
- Once the LEDs have gone out, pressing any of the four buttons will cause the LED next to it to light.
  - Check that all four buttons work, if this is not the case look at the switch fault finding flow chart.
- Turn the game off using SW5.
- If all four buttons tested OK, next time the game is turned on it will work normally.
Using the Game

- SW5 can be used to turn the game on and off (as indicated on the PCB).
- When the game is turned on LED1 & LED4 flash rapidly to indicate that a game should be selected. Press SW1 for the memory game or SW4 for the reactions game (both are marked on the PCB).
- If you wish to change the game you are playing turn the game off and back on and select the other game.
- Don't forget to switch it off when you’re not playing otherwise you will flatten the batteries.

Memory game

- The LEDs will flash a sequence. Simply copy this sequence.
- If you get it correct the LEDs will quickly flash in turn before the sequence is shown again with an extra LED on the end.
- When you do get it wrong the LEDs quickly flash in turn three times then your score is shown. The more LEDs you light the better you have done!

Reactions game

- After a random amount of time one of the four LEDs will be illuminated. Simply press the button next to the LED before the LED goes off.
- If you have pressed the button fast enough then a short while later a new LED will turn on but you have less time to press the button to stay in the game.
- When you don’t manage to press the LED fast enough the LEDs quickly flash in turn three times then your score is shown. The more LEDs you light, the better you have done!
Fault finding flow chart
For faulty LEDs

Check
- The batteries are good and in the right way around
- The game is turned on
- IC1 is present and the notch is near the board edge
- IC1 pins 1, 2, 8 (nearest the board edge) are soldered properly
- R7 is present, and soldered properly
- SW5 is present, and soldered properly
- R7 (the 47Ω - colour bands yellow, purple, black) has been put in to R1-R6

Power the board up whilst watching the LEDs

No LEDs turned on

The LEDs turned on but only very dimly

One or more LEDs turned on

No - One / two of the LED did not light

Were the LEDs in sequence (LED1, 2, 3, 4)?

Yes

LEDs are working move on to switch flow chart

No - one of the LEDs was missing, but then came on at the same time as another LED

The LED that was missing is soldered in to the board the wrong way round

How many LEDs didn’t work?

1

The LED that did not light is not properly soldered

2

Check
- For a solder shorts on one of the LEDs that didn’t light
- IC1 pins 3 & 5 are soldered correctly
- For a solder short on IC1 between pins 1 & 2 or pins 2 & 3
Fault finding flow chart
For faulty switches

Start

- R6 is missing or not soldered properly

- R5 is missing or not soldered properly

- In test mode once the LEDs have flashed

- Does it go out if SW4 is pressed?
  - Yes - LED3 is on constantly
  - No

- Does it go out if SW2 is pressed?
  - Yes - LED1 is on constantly
  - No

- Do any LEDs stay on?

- How many switches don’t work?
  - 1
  - 2
  - 3 or 4

- Check the soldering on
  - IC1 (pins 6, 7 & 8)
  - R1
  - R4

- The faulty switch is not soldered correctly

- SW1 & SW2
  - Either
    - R1 is not properly soldered
    - Pin 7 on IC1 is not properly soldered

- SW3 & SW4
  - SW3 lights LED1
  - SW4 lights LED2
  - There is a short on IC1 between pins 6 & 7

- Either
  - R4 is not properly soldered
  - Pin 6 on IC1 is not properly soldered

- R3 is missing or not soldered properly
Designing the Enclosure

When you design the enclosure, you will need to consider:

- The size of the PCB
- Where the LEDs are mounted and how big they are
- Where the switches are mounted and their size

Note: The PCB is symmetrical and, therefore, its length and the position of the LEDs and switches is the same in the vertical direction as well as the horizontal dimensions shown below.

This technical drawing of the game should help you to plan this. All dimensions are in mm.

Mounting the PCB to the enclosure

The drawing to the left shows how a hex spacer can be used with two bolts to fix the PCB to the enclosure.

Your PCB has four mounting holes designed to take M3 bolts.
At the heart of the electronic circuit is a microcontroller. A microcontroller is, in effect, a small computer. The circuit uses a clever design to allow four switches and four LEDs to be connected to only five input / outputs.

The switches are connected to an analogue to digital converter so that it gets a digital representation of the voltage on the input. A set of three resistors is used to make up a potential divider. As each of the resistors is the same value, an equal amount of voltage is present across each of these resistors. The top two resistors also have a switch across them. When the switch is pressed, the voltage across the resistor will become zero. So depending upon which of the two switches is pressed will depend upon what the voltage is at the point where it is fed into the PIC microcontroller. This allows the microcontroller to work out which button is pressed. The third resistor is used to prevent the batteries being rapidly flattened should both switches be pressed at the same time. The other two switches on the board work in the same way. This may sound overly complicated however it uses less input pins than switches with individual pull up resistors.

The LEDs are driven by three outputs. Because the LED only works when current flows through it in one direction, the four LEDs can be turned on by changing the outputs to make one high whilst another is low. More than one LED can be turned on if a little dimmer by taking it in turns to turn the LEDs on hundreds of times a second. The 47Ω resistor limits the current that can flow through the LED’s. This protects the LED and controls the brightness.
Online Information

Two sets of information can be downloaded from the product page where the kit can also be reordered from. The ‘Essential Information’ contains all of the information that you need to get started with the kit and the ‘Teaching Resources’ contains more information on soldering, components used in the kit, educational schemes of work and so on and also includes the essentials. Download from:
